                                                                                                                                                                                                                                                                                                                  also known as HDAC-A. The composition comprises antisense compounds that can be targeted towards HDAC4. The antisense oligonucleotide is useful for inhibiting the expression of HDAC4 in cells or tissues. It is also useful for treating an animal having a disease or condition associated with HDAC4, such as a hyperproliferative disorder, particularly cancer (i.e. myeloid leukaemia). The compound is used for diagnostics, prophylaxis, or as research reagents or kits. It is also useful in antisense therapy. The present sequence is an antisense oligonucleotide targeted towards human HDAC4 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo sapiens.

                                                                                                                                                                                                                                      composition comprising the new antisense compound and a pharmaceutical carrier or diluent; and a method of inhibiting the expression of Histone deacetylase 4 in human cells or tissues, comprising contacting the cells or tissues with the new compound so that the expression of Histone deacetylase 4 is inhibited. The antisense oligonucleotide is useful for modulating the expression of Histone deacetylase 4 in cells or tissues. It is also useful for treating humans having a disease or condition associated with Histone deacetylase 4, such as cancer, infection or inflammation. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human histone deacetylase 4 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               length targeted to a nucleic acid molecule encoding human Histone deacetylase 4 (which comprises a sequence of 8459 bp fully defined in the specification). The compound specifically hybridizes with and inhibits the expression of human Histone deacetylase 4. Also described are: a

The CC human mpGES-1 gene is located on chromosome 9, more specifically to 934.3. The present invention also describes: (1) antisense compounds, CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC inhibits its expression; (2) a method of inhibiting the expression of CC mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and CC inhibits its expression; (2) a method of treating an animal CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC antisense oligonucleotides and antisense compounds have cytostatic, CC antisinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, CC antiinflammatory, neuroprotective, nootropic, antiarthrities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or Ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁

The human mpGES-1 gene is located on chromosome 9, more specifically to CC human mpGES-1 gene is located on chromosome 9, more specifically to CC pg24.3. The present invention also describes: (1) antisense compounds, CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1 in cells or tissues; and (3) a method of inhibiting the expression of CC martisense oligonucleotides and antisense compounds have cytostatic, cantisense oligonucleotides and antisense compounds have cytostatic, cantisense oligonucleotides and antisense compounds have cytostatic, CC antistane oligonucleotides and antisense compounds have cytostatic, cophthalmological, immunomodulator, cardiant, neuroprotective, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antinflammatory, neuroprotective, nootropic, antinflammatory, neuroprotective, nootropic, antinflammatory, neuroprotective, nootropic, antienthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric
                                                                                                                                                                                                                                                                                       modified_base

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9344.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of treating the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisense compounds and contaction.
                                              antidiabetic, immunomodulator, cardiant, neuroprotective, antianflammatory, neuroprotective, nootropic, antianflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense compound, having a sequence targeted to a nucleic encoding mPGES-1, useful for preparing a composition for treatir inflammation, Alzheimer's disease, arthritis, diabetes, cancer of the composition of the composition of the compound of the c

                                                                                                                                                                                                                                                                                                                     RESULT 1540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression of isoprenylcysteine carboxyl methyltransferase (also known as CICMT, PCCMT, pcMTase, PPMT, PPMTase, HSTE14, MST098 and MSTP098) and CICMT, PCCMT, pcMTase, PPMT, PPMTase, HSTE14, MST098 and MSTP098) and CIC located on chromosome 1936. Specifically, it refers to compositions useful for inhibiting the expression of isoprenylcysteine carboxyl methyltransferase, which normally participates in cellular events such as growth factor signal transduction, cell replication, vesicular transport and the post-translational modification of the Ras family of GTPases. The present invention describes antisense oligonucleotides that comprise at least one modified sugar modety, a 2'-O-methoxyethyl (2' MOE) and at least one modified sugar modety, a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-methylcytosine. Accordingly, these compounds are useful for treating a disease or condition associated with isoprenylcysteine carboxyl methyltransferase such as a hyperproliferative disorder (e.g. cancer), an inflammatory condition, hypertension or cardiovascular disease. As such, they exhibit cytostatic, and are useful for research reagents and in diagnostics. This oligonucleotide sequence is a DNA oligo representing a preferred target site for antisense therapy in human isoprenylcysteine carboxyl methyltransferase, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

```
substituted pyrimidine analogue. The method is useful for labelling a nucleic acid. The method is useful for detecting a second nucleic acid of interest. The method is useful for labelling a nucleic acid which is used in hybridization assays, primer extension, terminal transferase additions, ligation, end labelling, PCR, nick translation labelling, reverse transcription, Southern blotting, Northern blotting, enzyme linked immunosorbant assay (BLISA), arrays, SKYE, cloning, transcription, abortive transcription, sequencing, diagnostic techniques, therapeutic applications, and treatment and prevention of diseases and conditions. The labelled nucleic acids are useful in assessing methylation state of specific genes, detecting presence of known genetic mutations, detecting mRNA expression levels, detecting presence of pathogenic organisms, and detecting and amplifying proteins. The present sequence represents a

                                                                                                                                                                                                                                                                                                                           The invention relates to a method of labelling a nucleic acid which involves incorporating at least one nucleotide analogue into a nucleic acid, where the analogue comprises an 8-S-substituted purine or 5-S-substituted pyrimidine analogue. The method is useful for labelling a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Labeling nucleic acid which is used in hybridization assays, primer extension, terminal transferase additions, involves incorporating 8-separative purine or 5-8-substituted pyrimidine analog into nucleic

The method of the invention has cycostatic activity. The method is used to diagnose embryonal and/or alveolar rhabdomyosarcoma. Also conjugates of antibodies (directed against the extracellular domain of R-cadherin or against membrane proteins of skeletal muscle cells) with anticancer agents or R-cadherin-suppressing RNA are used for treatment or prevention of embryonal and/or alveolar rhabdomyosarcoma. Labelled antibody conjugates directed against the extracellular domain of R-cadherin can also be used for in vivo detection of R-cadherin-expressing tumour foci. R-cadherin is the first specific marker for rhabdomyosarcoma identified and allows differentiation between rhabdomyosarcoma and other diseases such as osteosarcoma and Ewing tumour. The present sequence represents a RT-PCR primer used in the invention to amplify R-cadherin.

nucleic acid encoding isoprenylcystelne couseful for treating cancer, hypertension, inflammatory disease. New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding isoprenylcysteine carboxyl methyltransferase, or cardiovascular ç

Example 15; SEQ ID NO 23; 62pp; English.

CC expression of isoprenylcysteine carboxyl methyltransferase (also known as CI CNT, PCCMT, pcMTase, PPMT, PPMTase, HST14, MST098 and MSTP098) and CC located on chromosome 1936. Specifically, it refers to compositions CC useful for inhibiting the expression of isoprenylcysteine carboxyl carboxyl transferase, which normally participates in cellular events such as CC growth factor signal transduction, cell replication, vesicular transport CC and the post-translational modification of the Ras family of GTPases. The CC least one modified nucleobase antisense oligonucleotides that comprise at CC least one modified nucleobase, a 5-methylcytosine. Accordingly, these CC compounds are useful for treating a disease or condition associated with C1 comprenylcysteine carboxyl methyltransferase such as a hyperproliferative CC isoprenylcysteine carboxyl methyltransferase such as hyperproliferative CC cardiovascular disease. As such, they exhibit cytostatic, antiinflammatory, hypotensive and cardiant activities and are useful for cresearch reagents and in diagnostics. This oligonucleotide sequence is a phosphorothioate antisense DNA oligo used to modulate human CC exemplification of the invention. This invention relates to a novel antisense compounds that modulate the

                                                     genetic polymorphism marker is detected are prepared; (d) an genetic polymorphism marker is detected are prepared; (d) an amplification reaction of the genomic DNA is carried out in the presence of the primers 1, 2 and 3 and the two kinds of the oligonucleotides; (e) the fluorescence intensity emitted from the resultant reactional product is detected and (f) the position on the genome of the mutation site is determined from the results of detection. The present sequence is a
                                                                                                                                                                                 The present invention relates to a primer set and method for mapping at least the variation/mutation part of a plant gene using a gene polymorphism marker. A mutation site of the plant gene is mapped by utilizing a genetic polymorphism marker as follows: (a) genomic DNA is prepared from a plant homozygously having a mutation to be an object of the mapping; (b) A forward primer 1 containing a base corresponding to the gene polymorphic maker of one ecotype plant, a forward primer 2 containing a base corresponding to the genetic polymorphism of the other ecotype plant and a reverse primer 3 based on the base sequence common with both the ecotype plants are prepared; (c) two kinds of oligonucleotides emitting fluorescence of different colors when the

              compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,
                                                                                                                                                                                                                                                      New antisense compound targeted to a nucleic acid molecule encoding Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oligonucleotide compounds inhibit the expression of human Akt-1. Also disclosed is a method of inducing cytotoxicity in a cancer cell, comprising introducing into the cell an oligonucleotide that hybridises to a human Akt-1 sequence comprising RX-0194, TX-0201, RX-0616, RX-0627, RX-0638. The new compounds may be used in pharmaceutical compositions to, e.g. prevent or delay infection, inflammation or tumour formation. These are useful for research and diagnostics. The backbone of each oligonucleotide was modified during
                                                                                       The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nav1.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

                                    The present invention relates to a method for diagnosing embryonal rhabdomyosarcoma by in vitro detection, in a patient sample, of the expression of R-cadherin (I). The test sample, optionally treated, comprises a cell, collection of cells or tissue, and (I) expression is detected by measuring mRNA for (I), especially by reverse transcription (RT)-PCR or with an mRNA-specific probe, or (I) protein, using specific antibodies, e.g. by Western blotting. Primers for RT-PCR of (I) mRNA are DL97944 and ADL97946 (sense); and ADL97945 (antisense). Note: The present sequence is the SEQ ID 1 as shown in the disclosure. This sequence differs from the SEQ ID 1 shown in the Sequence Listing (see
                                                                                                                                                                                                                                      Diagnosis of embryonal ri
cadherin, also treatment
                                                                                                                                                                                                                                                                                                          Gauthier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, includir but not limited to neonatal or infantile epilepsy; or ataxia. The press sequence represents a chimeric phosphorothicate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.

The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                          Antilipaemic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.

The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                    Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                      Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                               respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. end of nucleic acid target comprising gene(s) chosen from eigen interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a

The present invention relates to an oligonucleotide anti-sense to e.g., Cinitiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. Cinterleukin (IL)-4 receptor, IL-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the coligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (F), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the

The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergic respiratory distress syndrome (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway hatter the prevention and contains a stream of the prevention of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       interleukin, IL-4 receptor; IL-5 receptor; lung disease; airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nyce JW, Ta

                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nuclecic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CP), chronic obstructive pulmonary diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory

The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                 Novel polynucleotide useful for PCR amplification along with two fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                JP2003259875-A

The present invention relates to a polynucleotide isolated from a gene and is useful for detecting a single nucleotide polymorphism human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel polynucleotide useful for PCR amplification along with two fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.

           induces senescence in a mammalian cell. The method comprises assaying the expression of cellular genes in the cell in the presence and absence of the compound. The method is useful for identifying and modulating expression of tumour senescence genes. These may be used in treating diseases or conditions related to abnormal cell proliferation or neoplastic cell growth, in assessing the efficacy of the treatment of the disease or condition, or in identifying compounds that induce senescence in mammalian cells or that inhibit senescence-associated induction of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a compound comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL-3), that specifically hybridises with the nucleic acid encoding PRL-3 and inhibits expression of PRL-3, i.e. is an antisense oligonuclectide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of PRL-3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with PRL-3 and screening for an antisense compound. The antisense oligonuclectide is useful for preparing a composition for treating hyperproliferative disorder, particularly cancer ((e.g. colorectal cancer), diabetes, reduced glucose tolerance, insulin resistance and obesity. The present sequence is an antisense oligonuclectide targeting human PRL3.
cellular gene expression.
                                                                                                                                                                              Example 4; SEQ ID NO 19; 102pp; English.
                                                                                                                                                                                                             Identifying compounds that induce senescence in mammalian cells, useful for treating e.g. cancer, comprises assaying the expression of cellular genes in the cell in the presence and absence of the compound.
                                                                                                                                                                                                                                                                                 WPI; 2004-091347/09.

                                                                            This invention relates to a novel DNA molecule which comprises a DNA molecule made up of the following elements in a 5' to 3' direction: a first restriction endonuclease site; a T3 promoter site; at least one Ta; gene comprising at least 5 20mer Tag sequences; a Poly A site having at least 1 consecutive A residues; a second restriction endonuclease site which may be the same or different than the first restriction endonuclease site; or a T7 Promoter on the opposite strand as the T3 promoter. The invention may be useful in nucleic acid analysis, in particular to synthetic Tag genes useful as assay controls, in assay development, product development and validation and for quality control. The present sequence is that of a Tag oligonucleotide probe which may be used during the creation of the novel DNA molecule of the invention.
                                                                                                                                                                                                                                                                                               New DNA molecules made by annealing and extending overlapping 60mer oligonucleotides, useful in producing synthetic Tag genes useful as controls, in assay development, product development and for quality

The compound specifically hybridises with the nucleic acid encoding Notchl and inhibits its expression. The compound has cytostatic and immunosuppressive properties and is suitable for used in gene therapy. The compound is useful for preparing a composition for treating a disease or condition associated with Notchl e.g., developmental, autoimmune or hyperproliferative disorders, such as cancer. This sequence represents an antisense oligonucleotide specific to human Notchl.
                                         New antisense oligonucleotide, comprising a sequence targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL -3), useful for preparing a composition for treating hyperproliferative disorders, e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense compound, having a sequence targeted to a nucleic acid encoding Notchl, useful for preparing a composition for treating a disease associated with Notchl e.g. autoimmune or hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                             US2003235911-A1.

ફ 밁

The invention relates to

Q)

compound comprising a sequence comprising

New antisense oligonucleotide, comprising a sequence targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PI -3), useful for preparing a composition for treating hyperproliferative

(PRL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disorder, particularly cancer (16.9). Occasional obesity. The present reduced glucose tolerance, insulin resistance and obesity. The present sequence is a Human PRL3 cDNA AO target region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             base pairs (bp) targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL-3), that specifically hybridises with the nucleic acid encoding PRL-3 and inhibits expression of PRL-3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of PRL-3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with PRL-3 and screening for an antisense compound. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative disorder, particularly cancer (e.g. colorectal cancer), diabetes,
                                                                                                                                                                                                                                                        modified_base

The polynucleotides and polypeptides defined in the specification, antisense polynucleotides targeting the polynucleotides, antibodies targeting either one of the polynucleotides or polypeptides, and compounds identified by the screening methods are useful for preventing or treating malignant neoplasia. The disease treated is preferably breast cancer. The present sequence is that of a PCR primer which was used in the exemplification of the invention.
                           New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding PTP1B, useful for treating a disease/condition associated with PTP1B, such as cancer, diabetes or obesity.
                                                                                                                                                                                                                                                                                                                 18-JAN-2000; 2000US-00487368

                                                                                                                                                                                                  CC This invention relates to novel compositions and methods for modulating the expression of PTP1B (also known as protein phosphatase 1B and PTPNI). C Specifically, it refers to antisense compounds that can target and c hybridise with a nucleic acid molecule encoding PTP1B, as well as splice covariants thereof and inhibit expression accordingly. PTP1B is a tyrosine c phosphatase that plays an essential regulatory role in signalling c mediated by the insulin receptor and as such is useful for treating c diseases such as type 2 diabetes and obesity. Furthermore, PTP1B can c suppress transformation of oncogenic genes, such that compositions of this invention can also be used to treat hyperproliferative conditions of including cancer. Accordingly, these compounds can be described as having c cytostatic, antidiabetic and anorectic activities. This oligonucleotide sequence is an antisense DNA oligo that targets rat PTP1B DNA, and which has a phosphorothioate backbone and 2 -O-methoxyethyl wings, used in an order compounds.

The polypeptide is characterised by decreased specific binding combined to an antibody selected from GAD6, MICA-1, MICA-3, MICA-4 and MICA-6, CC where the decreased binding is relative to a corresponding GAD65 complete the decreased binding is relative to a corresponding GAD65 complete the presence of or risk of type 1 diabetes in a subject; CC for detecting the presence of or risk of type 1 diabetes in a subject; CC (2) an isolated mucleic acid selected from: (a) mucleic acids which encode the card Ian5(1yp) polypeptide; or (c) full length complements of the nucleic acids of (a) or (b); (3) an antibody that: (a) specifically binds to rat [an5(1yp) polypeptide; or (c) full length complements of the nucleic acids of (a) or (b); (3) an antibody is not immunologically cross-creactive with human Ian5 or mouse Ian5 polypeptide; or (b) specifically binds to rat [an5(1yp) polypeptide, where the antibody is not immunologically cross-reactive with rat Ian5(1y), human Ian5 or mouse Ian5 (1yp) polypeptide; where the following composition of the polypeptide; or (b) specifically cross-creative with rat Ian5(1y), human Ian5 or mouse Ian5 (c) polypeptide; (d) an expression construct comprising the following composition of the present comprising the composition construct described above; (a) a vector comprising the composition end antended for producing an Ian5 polypeptide; (c) an isolated host cell transformed or transfected with the composition end methods for diabetes and (11) a method for identifying agonists or antagonists of an Ian5 (c) methods for developing gene therapy for type 1 diabetes, and (11) a method for identifying a genetic mutation that correlates with type 1 (alabetes, GAD65 has antidabetic activity, and can be used in gene therapy for type 1 diabetes. The methods may also be constituted and the present invention. The present constitution of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a compound targeted to a nucleic acid molecule encoding Notch1 and which inhibits the expression of Notch1. The compound, composition and methods are useful for treating a disease or condition associated with Notch1, such as an autoimmune disorder, aberrant apoptosis or a hyperproliferative disorder, e.g. cancer. They are also useful in research and diagnostics for modulating the expression of Notch1. The present sequence represents a human Notch1 antisense
                                                                                           This invention relates to a novel method for the prediction, diagnosis, or prognosis of malignant neoplasia by the detection of at least two markers. The invention may also be useful for the development of cytostatic compounds through the regulation of the expression of a gene or activity of a protein associated with malignant neoplasia. The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gastric cancer;

The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emplysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

CC The invention also describes a kit, that comprises: (a) a delivery comprise, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, an estaing a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascoonstriction, comprises syndrome, pain, cystic fibrosis, allergier, asthma, impeded respiration, respiratory hyperrension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system c.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

Example 2; SEQ ID NO 32; 87pp; English

New GAD65 polypeptide comprising the presence of or risk of developments.

developing

type

an

E517P mutation, useful for detecting ng type 1 diabetes or a related

disorder in human subjects.

```
CC surfactant depletion or hyposecretion, when administered to a mammal. The CC expression of a target polypeptide associated with lung airway or lung CC dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung confilammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, confilammation, emphysema, chronic obstructive pulmonary disease, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary confilament of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system confilation, heart, kidney, etc, tissue environment and thereby, to

CC bring ourgonucleotides, effective for alleviating creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, construction or hyposecretion, when administered to a mammal. The colligonucleotides are derived from a gene encoding or regulating certification or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating certification or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analyses; (b) the oligonucleotides, (c) beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered corravailability, or to increase the degradation of the production of availability, or to increase the degradation of the production of the composition is setful for preventing or treating a respiratory.

                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                  5
                                                                                                                                                                                                                                                                                                                                                                                                     CC The invention also describes a kit, that compositions (a) a delivery (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a ccarrier and for use of the kit. The composition composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or burnchoconstriction and/or lung cinflammation, allergies and/or surfactant hypoproduction are associated composition, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation repection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system c.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and pronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptor surfactant depletion or hyposecretion, when administered to a mammal. I oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted nucleic acids associated with lung airway or lung dysfunction, and

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

SEQ ID NO 4894; 763pp; English.

CC comprising oligonucleotides, effective for alleviating composition, respiratory tract inflammation, allergies and CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, CC surfactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating CC expression of a target polypeptide associated with lung airway or lung CC dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or burdactonstriction and/or lung pulmonary obstruction, and/or burdactonstriction and/or lung inflammation, allergies, asthma, impeded respiration, respiratory complete systems, content of the anti-sense oligos corresponding to the reduced adenosine content of the anti-sense oligos corresponding to the coligonucleotides into products that free adenosine into the system of the street and products that free adenosine into the system of the coligonucleotides into products that free adenosine into the system of the sure environment and thereby, to prevent This invention describes a novel composition any unwanted effects due ç (a) a first active agent,

CC expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery construction also describes a kit, that comprises: (a) a delivery construction also describes a kit, that comprises: (a) a delivery construction also describes a kit, that comprises: (a) a delivery construction also acarrier and for use of the kit. The composition of the invention has antiallergic, antiinflammacory, antiasthmatic, an estating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or surfactant hypotroduction are associated with a disease or condition such as pulmonary vasoconstriction, are distress syndrome, pain, cystic fibrosis, allergie rininitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system c.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptor surfactant depletion or hyposecretion, when administered to a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 15; SEQ ID NO 13890; 763pp; English

CC COMPONIC
CC C
CC comprising oligonuclectides, effective for alleviating CC pronchoconstriction, respiratory tract inflammation, allergies and CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, considered in the process of the invention of a target polypeptide associated with lung airway or lung CC dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiastbmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a CC treating a respiratory, lung or malignant disease. The administered CC composition comprises oligo and is administered to reduce the producrion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8888

The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targuncleic acids associated with lung airway or lung dysfunction Pharmaceutical composition oligonucleotide containing bronchodilating agent. e of adenosine, targe or lung dysfunction, adenosine, targeted ç

WPI; 2003-093058/08.

Claim 15; SEQ ID NO 4183; 763pp; English.

CC expression of a target polypeptide associated with lung airway or lung conversion or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or CC treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to CC reduce the amount of target polypeptide present in the lungs. The CC pulmonary obstruction, and/or bronchoconstriction and/or lung confidence the production, and/or bronchoconstriction and/or lung confidence the associated confidence the production such as guimonary vascoconstriction, respiratory confidence or condition such as guimonary vascoconstriction, respiratory confidence membry sens, chronic obstructive pulmonary disease, pulmonary confidence membry disease, chronic obstructive, pulmonary disease, pulmonary confidence present in the target RNA serves to prevent the breakdown of the many brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) recusing adenosine sensitivity, levels of adenosine (A) or (A) recusing adenosine sensitivity, when administered to a mamma surfactant depletion or hyposecretion, when administered to a mamma oligonucleotides are derived from a gene encoding or regulating describes a novel composition (a) a first active mammal. receptors, mammal. Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 186; 763pp; English

CC comprising oligonucleotides, effective for alleviating CC comprising oligonucleotides, effective for alleviating CC comprising oligonucleotides, effective for alleviating allergies and CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, cc surfactant depletion or hyposecretion, when administered to a mammal. The CO ligonucleotides are derived from a gene encoding or regulating cc expression of a target polypeptide associated with lung airway or lung cc expression of a target polypeptide associated with lung airway or lung cc expression of a carget polypeptide associated with lung airway or lung cc expression of a carget polypeptide associated with lung airway or lung cc expression of a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, cc analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or cc treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production cc reduce the amount of target polypeptide present in the lungs. The cc pulmonary obstruction, and/or bordonstriction and/or lung cristian allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction. Tespiratory clinthammation, allergies, asthma, impeded respirator, respiratory customated surfaces syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary obstructive pulmonary disease, pulmonary conditions obstructive pulmonary of cancer.

CC The reduced adenosine content of the anti-sense oligos corresponding to The reduced adenosine content of the anti-sense oligos corresponding thymidines present in the target RNA serves to prevent the breakdown the oligonucleotides into products that free adenosine into the syste This invention describes a novel composition (a) a first active agent, of of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC bronchoconstriction, respiratory tract inflammation, allergies and CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, CC surfactant depletion or hyposecretion, when administered to a mammal. The CO oligonucleotides are derived from a gene encoding or regulating CC expression of a target polypeptide associated with lung airway or lung CC dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition CC instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, (c) analyssic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or creating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The CD pulmonary obstruction, and/or bronchoconstriction and/or lung cinflammation, allergies and/or surfactant hypoproduction are associated confinammation, allergies and/or surfactant hypoproduction are associated confinamentor, allergies, asthma, impeded respiration, respiratory construction respiratory disease, pulmonary construction respiratory disease, pulmonary infective pulmonary disease, pulmonary construction and constructive pulmonary disease, pulmonary construction and constructive pulmonary disease, pulmonary construction and constructive pulmonary disease, pulmonary constructive pulmonary disease, pulmonary constructive pulmonary disease, pulmonary constructive pulmonary disease, pulmonary constructive pulmonary disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targe nucleic acids associated with lung airway or lung dysfunction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 15; SEQ ID NO 1958; 763pp;

                                                                                                                                                                                                                   CC composition of ligonucleotides, effective for alleviating control or reducing adenosine sensitivity, levels of adenosine (A) receptors, cc surfactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating cc expression of a target polypeptide associated with lung airway or lung cc dysfunction or cancer and can be anti-sense to the corresponding mRNA. cc instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, in separate containers, (b) the oligonucleotides, (c) constructions for adding a carrier and for use of the kit. The composition conficts the invention has antiallergic, antiinflammatory, antiasthmatic, analysic, hypotensive, immunosuppressive and cytostatic activity, is a ctreating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition such as pulmonary vasoconstriction, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, respiratory conditions, allergies, asthma, impeded respiration, respiratory conditions, polypertension, emphysema, chronic obstructive pulmonary disease, pulmonary disease, pulmonary infections, bronchities or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the server of the anti-sense oligos corresponding to the order of the anti-sense oligos corresponding to the products in the target products and contents that free adenociate in the tree adenociate in the products and contents that free adenociate in the products and conten

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of calculating a rate factor, which is proportional to initial rate, for hybridisation to an RNA molecule by a given antisense nucleic acid. The method involves calculating the meltin energy required to convert specific regions of the RNA molecule to a single-stranded state; the energy gain resulting from hybridisation of the specific regions of the RNA molecule to an oligonucleotide; and the rate factor. The method is useful for calculating a rate factor that is proportional to a rate constant for hybridisation between complementary nucleic acide. The method is particularly useful for estimating initial rates, predicting nucleation sites and selecting target sites for antisense attack of RNA. The invention is useful in antisense generated the second secon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Calculating a rate factor that is proportional to initial rate, for predicting nucleation sites and selecting target sites for antisense attack of RNA, comprises calculating the melting energy and energy gain of regions of the RNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression. TRIP6 is also known as OPA-interacting protein-1 (OIP-1) and zyxin-related protein-1 (ZEP-1). TRIP6 DNA is located on chromosome 7q22. Antisense compounds of the invention are useful for modulating the expression of TRIP6 and for treating diseases or conditions associated with the expression of TRIP6 such as hyperpoliterative disorders (e.g. cancer). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. The are also useful in antisense therapy. The present sequence is an antisense oligo targetted to human TRIP6 DNA. This oligo is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises the amino acid and coding sequence of a von Willebrand factor (vWF)-cleaving enzyme. The DNA and protein sequences of the invention are useful in the diagnosis and treatment of thrombocytopenic purpura, and in developing drugs for myocardial infarction, cerebral infarction, arteriosclerosis, platelet thrombosis, and stenosis. The present DNA sequence represents a human von Willebrand factor (vWF) closers present DNA sequence represents a human von Willebrand
                                                                                                              Human; ds; protease inhibitor; gene therapy; vWF-cleaving enzyme; von Willebrand factor-cleaving enzyme; thrombocytopenic purpura; myocardial infarction; cerebral infarction; arteriosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         von Willebrand factor-cleaving enzyme, applicable in diagnosis of, and supplementary therapy for, thrombotic thrombocytopenic purpura, and for developing drugs for e.g. myocardial infarction and cerebral infarction
                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                von Willebrand factor-cleaving enzyme; thrombocytopenic purpumyocardial infarction; cerebral infarction; arteriosclerosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       useful in any bioluminescent assay which utilises luciferase/luciferin reaction as signaling mode. The present sequence is probably a mutagenic PCR primer used to construct a DNA encoding a mutant luciferase from Photinus pyralis, however it is displayed in figure 8, a figure not referred to anywhere in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lampyris noctiluca, Pyrocoelia nayako or Photinus pennsylanvanica , where in the luciferase, an amino acid is different from a corresponding residue in wild-type and has increased thermostability. Also included are a nucleic acid which encodes the thermostable luciferase, a vector comprising the nucleic acid, a cell transformed with the vector, a plant comprising the cell, producing the thermostable luciferase and a kit comprising the thermostable luciferase. The thermostable luciferase is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 22 BP; 4 A; 7 C; 5 G; 6 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New luciferase enzyme having increased thermostability and which is a mutant form of the wild-type enzyme, useful for bioluminescent assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Murray JAH,

The invention relates to a luciferase (thermostable mutant) having 60% csimilarity to luciferase of Photinus pyralis, Luciola mingrelica, CC L.cruciata, L.lateralis, Hotaria paroula, Pyrophorus plagiophthalamus, CC Lampyris noctiluca, Pyrocoelia nayako or Photinus pennsylanvanica, where in the luciferase, an amino acid is different from a corresponding CC residue in wild-type and has increased thermostability. Also included are a nucleic acid which encodes the thermostable luciferase, a vector cCC comprising the nucleic acid, a cell transformed with the vector, a plant CC comprising the thermostable luciferase and a kit CC comprising the thermostable luciferase and a kit CC comprising the thermostable luciferase is useful in any bioluminescent assay which utilises luciferase/luciferin CC primer used to construct a DNA encoding a mutant luciferase from CC PCR primer used to construct a DNA encoding a mutant luciferase from CC PCR primer used to construct a DNA encoding a mutant luciferase from CC PCR primer used to construct a DNA encoding a mutant luciferase from CC photinus pyralis, however it is displayed in figure 8, a figure not construct a DNA encoding a mutant luciferase from CC referred to anywhere in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New luciferase enzyme having increased thermostability and which mutant form of the wild-type enzyme, useful for bioluminescent as

                                                                                                                                                                                                                                              The invention relates to a luciferase (thermostable mutant) having 60% similarity to luciferase of Photinus pyralia, Luciola mingralica, L. lateralis, Hotaria paroula, Pyrophorus plagiophthalamus, Lampyris noctiluca, Pyrocoelia nayako or Photinus pennsylanvanica, where in the luciferase, an amino acid is different from a corresponding residue in wild-type and has increased thermostability. Also included are a nucleic acid which encodes the thermostable luciferase, a vector comprising the nucleic acid, a cell transformed with the vector, a plant comprising the cell, producing the thermostable luciferase and a kit comprising the thermostable luciferase. The thermostable luciferase is useful in any bioluminescent assay which utilises luciferase/luciferin reaction as signaling mode. The present sequence is a mutagenic PCR
